**Abstract:** Introduction: The aim of the present study the behavioral characteristics of preschool children was employed and unemployed mothers.  
Methods: The present study has been done in a form of casual-comparative on 60 patients in the Baneh city were carried out with cluster random sampling. In the present study, Questionnaire of 27 questions about behavior problems in preschool children were employed to gather the required data. For data analysis, a Independent t-tests by SPSS-21 software was used.  
Result: The results showed that the characteristic behavior of neglected children, children in both groups there was a significant difference between employed and unemployed mothers. And the characteristics of isolation and anxiety in children of mothers employed and unemployed, significant differences were found. Between aggression features both employed and unemployed mothers of children was also significant.  
Conclusions: The results showed that maternal employment on maternal attachment relationship - the child will have a negative impact And behavioral characteristics of other children Including isolation, neglect and childish behavior and anxiety would be ineffective.
