**Abstract:** Introduction and Objectives: The aim of the present study was to examine the role of parenting styles and adolescents' perception of interparental conflict in their aggressiveness.

Methods and Materials: In this causal-comparative study 160 first grade high school students (male and female) were randomly selected. Parenting styles Questionnaire (Shaffer), adolescents' perception of interparental conflict scale (Grych, Seid & Fincham) and aggression Questionnaire (Buss & Perry) were administered. These Questionnaire were completed by students. Multivariate analysis of variance analysis of variance, Independent t & regression analysis test were used for analyzing data.

Results: The results indicated significant difference between components of adolescents' perception of interparental conflict among aggressive and non-aggressive group (P<0/05). Also, there was significant difference between aggressive and non-aggressive adolescents in their parenting styles (P<0/05). In addition, significant difference between girls and boys mean scores in aggression scale was observed. Multiple regression analysis showed that kindness dimension of the parenting styles had crucial contribution in prediction of the adolescents' aggression.

Conclusions: The findings have implications for studying etiology and family dynamics. Also, the role of adolescents' perception of interparental conflicts in explaining present findings is considerable.
