Introduction: This study was designed to investigate attachment to God, resiliency and life satisfaction of mothers with exceptional children. The objective of this research was to investigate the relationship between attachment to Gad and Resilience with life satisfaction in mothers of children with exceptional needs.

Method and Materials: The design of the study was descriptive and correlational. The sample of this study included 60 mothers who have children with exceptional needs. In this study, participants completed the Attachment to God Questionnaire (Rowatt & Patrick, 2002), Resiliency (Korner & Daividsen, 2003), and life satisfaction (Dinner & et. al., 1985). Data was analyzed by applying regression (stepwise method) and correlation coefficient.

Results: Results of the analysis indicate a significant negative correlation between attachment style of Ambivalent and life satisfaction. Other components did not significantly contribute to the prediction of criterion variable.

Conclusion: The total results of this research showed that attachment style of Ambivalent and resilience are predictors of life satisfaction in mothers of exceptional children.

Key words: Attachment to God, Resilience, life satisfaction, mothers, Exceptional children.
