Abstract: Introduction: eating and feeding are the primary goal that both mother and child may try to achieve as a common aim.
Objectives: the goal of the present study is to investigate different types of eating disorders in 3-6 year-old children in daycare centers of Gorgan.
Method and Materials: this study is a descriptive one. The statistical participants were all 3-6 years old children of daycare centers in city of Gorgan. 100 children were chosen in a simple random sampling and their mothers replied to children’s eating problems questionnaires. The data have been analyzed by descriptive statistics including abundance (frequency), percentage, and diagram.
Results: The findings demonstrate that of subscales of eating problem questionnaires the least was mother’s satisfaction in eating.
Conclusion: food type, eating manner, as well as meal time of the children could be the main reasons of the parents’ mental pressure.
