**Title:** Frequency of Firesetting in Primary School Children of Shiraz, Iran, ; Spring 2013.

**Authors:** Ali Alavi, Maryam Zare'ei

**Abstract:**
Introduction: All of the children may be attracted normally to fire in during their development. However, fire setting has an inappropriate and uncontrolled nature and is accompanied by economical burden, physical injuries and death. Fire-setting is a criterion for conduct disorder and may be related to other psychopathologies and substance use disorder. On the other hand, fire-setting may be a predictor of other psychopathologies such a antisocial personality disorder and impulse control disorders. The present study has been performed to evaluate the frequency of this problem in school aged children.

Methods: In a cross-sectional study, Comprehensive Parent Fire-risk Questionnaire (a part of Coprehensive Firerisk Evaluation) was used to evaluate the frequency of high risk in 400 children selected by of multistage, cluster sampling method among primary school students.

Results and conclusion: The study is in the stage of analysis. The final results of the study will be presented in the congress.
