**Abstract:**
Introduction: the role of family in educating and shaping attitudes, generally, values and culture of its members plays in the development of children's personality affect her later in life.
Objectives: This study examined the relationship between personality and parenting style were implemented.
Methods: 80 subjects whose parents had high school education, were asked to Eysenck Personality Questionnaire (adult form), and to complete a questionnaire Bamrynd parenting. The data for the analysis of indicators and statistical methods including frequency, mean and chi-square test was used.
Results: Results of chi-square test showed a significant relationship between parenting style and personality type exists, between parenting style and personality type also unstable - stable, there is a significant relationship. The findings also indicate a significant relationship between gender and introverted personality types - extrovert, and volatile - sustainable, gender and parenting style was not well.
Conclusions: Family atmosphere and parents can, in a sense of self and their ability to be effective. Styles of authoritarian, dictatorial or free transition, early and late can cause unwanted consequences for children. Parents of personality, introverted or extroverted personality that parent, the parenting style is important.
