**Title:** Comparison the happiness and willingness to communicate in the three classes of the attachment in student population

**Authors:** Dr. Mansour Bayrami, Vahab Mohammadpour, Mojtaba Gholamzadeh, Bahman Esmaeili

**Abstract:** Introduction: The first emotional bonds between child and mother be assimilation in the form mental models, Generalized to wide range of child Interpersonal Relations in future and this pattern of relationships, Namely the attachment styles throughout life remain relatively stable. Attachment styles in adulthood can be influence factors on the psychological and social relations. The present study aimed to comparative happiness and willingness to communicate in the three classes of the attachment in a sample of non-native students of Tabriz University.

**Method:** Using cluster sampling, 400 students were selected. For the measurement of the given variables, Hazan and Shaver’s Adult Attachment Styles Scale and Memorial University of Newfoundland scale of happiness (Munsch) and McCroskey’s willingness to communicate scale were applied. The results were analyzed using one-way analysis of variance (ANOVA) and the post hoc multiple comparisons.

**Results:** finding showed that there is significant differences between attachment styles on happiness and so there are significant differences between attachment styles on willingness to communicate.

**Conclusion:** The results showed that Students with secure attachment style Compared with ambivalent and avoidant non-secure student have a high levels of happiness. Another result showed that Students with secure attachment style compared with ambivalent and avoidant non-secure student have a high levels of willingness to communicate and students with ambivalent attachment style compared with avoidant students have high levels of willingness to communicate. Based on Results previous findings can explain such that, secure attachment associated with positive characteristics, including intimacy and satisfaction and lower levels of avoidant attachment with intimacy and commitment, and ambivalent attachment associated with passion and concern about relationships combined with low satisfaction. The overall result is that attachment styles effect on happiness and willingness to communicate.
