Introduction
There has been a tremendous increase in the use of mobile phones in the past decade and concerns are growing about the possible hazardous effects of radiofrequency electromagnetic waves (EMW) emitted by these devices on human health. Reports of potential adverse effects of radiofrequency EMW on brain, heart, endocrine system, and DNA of humans. Recent studies also suggest that EMW emitted from cell phones can reduce the fertilizing potential of men. On the other hand, education serves as the means to bring about the desired change about this phenomenon and develop a generation of virtuous individuals and thus contribute to the development of good human habits. This study looks at the relationship between cell phone use and male infertility and also the importance of education for this new and hazard technology.

Methodology
This study is a reviewing article and uses library resources and journals and sites such as Pub Med, Science Direct and Web Med, Sic Topics from years 2008 to 2010. We systematically searched these resources and found 14 articles, select 10 articles as related and valid articles.

Results
As said above, recent studies suggest that EMW emitted from cell phones can reduce the fertilizing potential of men. Several studies on mobile phone emissions indicate that these radiations may alter hormone secretion due to deformation of Leydig and Sertoli cells, which may lead to cell proliferation. Such type of alteration may also decrease the sperm count and may also cause DNA strand break. Use of cell phones adversely affects the quality of semen by decreasing the sperm counts, mobility, viability and morphology, which might contribute to male infertility.

Conclusion
There are risks for people associated with the use of cell phones. As technology is advancing, new risks will present themselves. Education is the process of learning and knowing, it is a holistic process and continues through our life; it would not be an exaggeration to say that the existence of human beings is fruitless without education. Education spreads awareness, informing us about rights and wrongs. By educating people about hazardousness of excessive use of cell phones we can help them to reduce their problems particularly infertility problems.

Education, cell phone use, infertility, men infertility
