**Title:** A glance on occupational health education among students and medicine graduates  
**Authors:** Aram Tirgar*- Habib Akhavan Attar

**Abstract:** Introduction: As work force and hours excessively increase in our country like many others, health and medical needs of the workers about related services are vital and essential for the community. Putting occupational services in Primary Health Care (PHC) system is the other possible witness in this regards. So, the aims of this article are: 1. Reporting the condition of occupational health education in Iranian medical schools, 2. Presentation of results at awareness and exposure of General Practitioners (GP) about occupational health, and 3. Comparison of these conditions with other countries.

Method: A descriptive survey designed for the assessment of the how's and whys of occupational health education in medical schools all over Iran, and another project, occupational health information and exposure among GPs were collected through direct visit. Finally, our results were analyzed accompanied with data in literature.

Findings: Our results show that, 28 out of 30 responded schools had program about occupational health education. The mean of occupational health training time was 4.2 hours and 12 out of 30 only were theoretical. On the other hand, 149 out of 183 GPs completely answered to our questions. One hundred twenty originated from their job, and 122 one needed to related training.

Conclusion: According to our results comparing to other schools in similar country, the quality and the quantity of occupational health training in Iranian medical schools are few in number, and probably they are not enough to meet the patients' needs. Therefore, doing more researches to revise occupational health training program is recommended.
